

The cell phone as a secure modem for Internet connection

GMV develops software for connecting to internet in a convenient, quick and safe way, using any GPRS/3G device as modem.

Madrid, 10 April 2007.- As part of its ongoing commitment to areas of specialization and innovation, GMV has now brought on line its e-nmediato product, to add to its range of solutions for telecommunications operators.

e-nmediato is a software program that can be fitted to a suitable device for making connections to internet in a quick and convenient way, using as modem a GPRS/3G terminal such as a cell phone or PCMCIA card. It can also be used for other functions such as traffic control, power-consumption control, SMS sending and receiving, synchronization and agenda maintenance, etc.

The connections managed by this application provide access at broadband speed thanks to the UMTS/3G technology and the new HSDPA/3.5G technology. It also guarantees maximum connection availability by automatic switching between 3G and GPRS networks if the signal is lost.

The e-nmediato product can be used on a wide range of terminals and operating systems. Current versions can be fitted on a personal computer (with Windows Vista, XP, 2000 operating systems) or a PDA (Windows Mobile 2005, PalmOS). As well as the client application the product is also web enabled for managing and storing use statistics, keeping a record of such statistical data as the number of connections in each time band, the operating system used or type of terminal used.

One of e-nmediato's most important features is its security module. It protects the terminals from malicious access and controls the traffic running on the connections set up by e-nmediato.

The product is currently being distributed by one of the main cell phone operators, which offers it to its subscribers as a personalized version. GMV will continue to develop the product, however, to be able to market it through other clients. Scheduled improvements include the creation of new versions for Macintosh and Linux operating systems.
