The industrial robotics sector, growing at an annual rate of 6%-12%, now turns over 25 billion euros a year. Some of its standout areas of application are the surveillance and monitoring of critical infrastructure (e.g. oil and gas plants) and major installations, supervision of large power lines and pipelines, logistics, precision agriculture, self-driving cars, surgery and the exploration of space and the underwater world.

As well as this inwardly driven growth of industrial robotics there has also been a surge in recent years of professional and service robotics (home automation, education, leisure and entertainment), driven by the development of complementary, low-cost technology.

Building on the success of recent years GMV is now organizing the fifth “GMV Robotics Day” to showcase the current state of robotics technology and its many applications.

The 5th GMV Robotics Week is part of the European Robotics Week (23-29 November, 2015) with over 400 robotics-related events planned throughout Europe.
